The sun emits radiation in the form of ultraviolet (UV) light, which is classified into three types of wave length: UVA, UVB and UVC. The ozone layer blocks all UVC light (the shortest wave length), but UVA and UVB light can pass through. Both UVA and UVB reach the earth's surface because they are not fully absorbed by the ozone layer. UVA penetrates deeply into the skin, and is the type of UV radiation that causes wrinkling or leathering of the skin. UVB is the type of radiation that causes sun burns. Both types cause skin cancer. Every year in the United States, over one million people are diagnosed with skin cancer. Over exposure to UV radiation can also cause eye cataracts, eye damage, skin aging, growth on the skin and suppression of the immune system. So remember, when you go outside wear sun screen!

Our summer contest is a favorite for the Taylor Team. We enjoy receiving, reading and posting all the postcards sent in. It's simple, all you need you to do is send us a postcard, photo or letter from anywhere. It's that easy! If you want a chance to win, we must receive a postcard. The more you send, the better your chances of winning. The winner will receive a \$ 50.00 mall gift certificate. Good luck!

### Interesting Information

It has been 40 years since the United States landed Apollo 13 on the moon. On July 20, 1969, Commander Neil Armstrong became the first man on the moon. He said the historic words, "One small step for man, one giant leap for mankind". What he meant to say was, "One small step for a man, one giant step for mankind". Regardless, it has become one of the most well known quotes in the English language.

### Useless Trivia

The word 'Queue' is the only word in the English language that can be pronounced the same even if the last four letters have been removed one by one

### Extra Token Question

How many ways can you make change for one dollar?
